Cleaning vs Sanitizing vs Disinfecting

Although the terms are used universally, they mean different things.

- **Cleaning** removes visible matter.
- **Sanitizing** reduces the level of bacteria and viruses present.
- **Disinfecting**, when done according to instructions, kills all bacteria and viruses present.

Antimicrobial?

COVID-19 has caused a re-promotion of antimicrobials

Antimicrobials are regulated by the EPA

- Used to suppress/destroy harmful microorganisms on inanimate objects and surfaces.
- Over 250 ingredients and 4,000 products registered with the EPA.

Antimicrobials are found in many items such as door handles, fabrics (even active wear), bedding, cell phones and more.

Antimicrobial doesn't mean "zero bacteria".

Antimicrobials DO NOT protect humans from the spread of infectious diseases.
